

BASIX Control Units

	ORDER CODE	Onga WaterSwitch Automatic Rainwater Controller WaterMark approval number WMKA21068 in accordance with ATS5200.477-2006.
	ONGA28M	With 28 metre head submersible pump
	ONGA28MI	With 28 metre head pump installed in factory
	ONGA35M	With 35 metre head submersible pump
	ONGA35MI	With 35 metre head pump installed in factory

WaterSwitch is a dual source valve that utilises water captured within a rainwater tank to supply water requirements around the home, including washing machines, toilet flushing and garden watering.

WaterSwitch is a fully automatic device that has the ability to detect the level of water inside the tank so it can ensure a seamless supply of water to the home. When the tank is filled during rainfall, WaterSwitch detects the level of water in the tank rising off the bottom, and automatically diverts demand on the system to be supplied with the available rainwater. When the water level in the tank falls below a specified level, the WaterSwitch seamlessly switches all demands on the system over to mains water temporarily, to ensure that supply is not interrupted.

- Switches between sources automatically
- Dual check valve prevents backflow
- Easy plumbing connections
